

Chapter –07

Motivation Concepts

Motivation is *a need or desire that energizes and directs behavior.*

Motivation is the processes that account for an individual's intensity/passion, direction, and persistence of effort toward attaining a goal.

SELF MOTIVATION

Suchitra Singh
28/11/2017

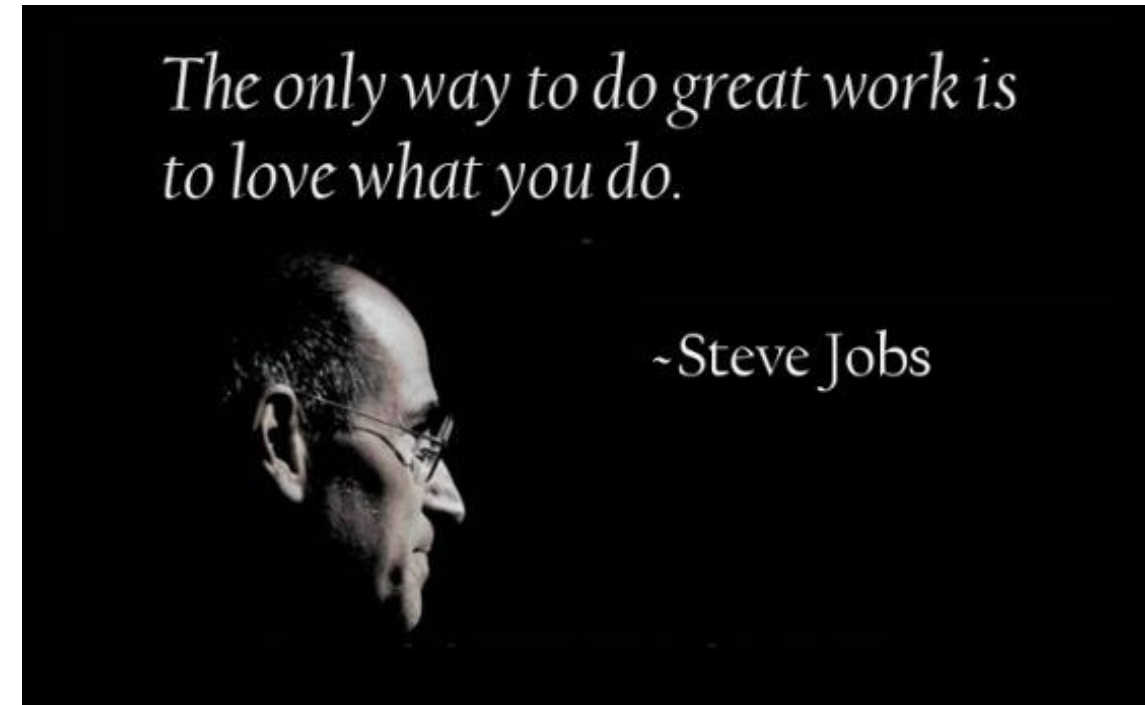

The three key elements in our definition are intensity, direction, and persistence.

- **Intensity** describes how hard a person tries.
- However, high intensity is unlikely to lead to favorable job-performance outcomes unless the effort is focused in a **direction** that benefits the organization.
- Finally, motivation has a **persistence** dimension. This measures how long a person can maintain effort. Motivated individuals stay with a task long enough to achieve their goal.

Theories of Motivation

Early Theories of Motivation

1. Hierarchy of Needs Theory
2. Theory X and Theory Y
3. Two Factor Theory
4. McClelland's Theory of Needs

Contemporary Theories of Motivation

1. Self-Determination Theory
2. Goal-Setting Theory
3. Self-Efficacy Theory
4. Equity Theory
5. Expectancy Theory

1. Abraham Maslow's Hierarchy Of Needs Theory

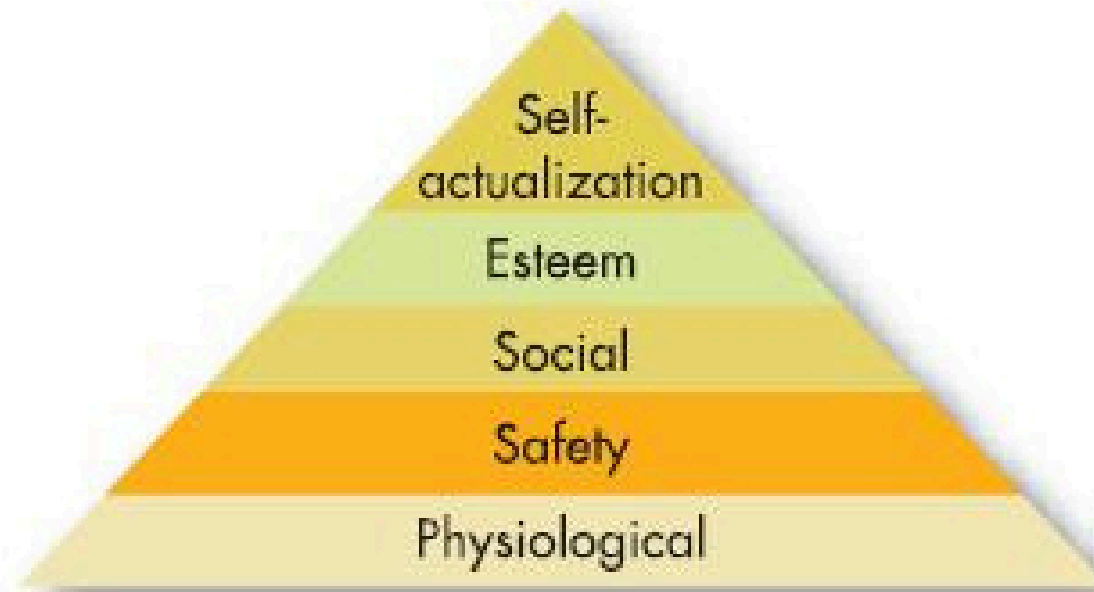

Maslow's Hierarchy of Needs is a motivation theory proposed by Abraham Maslow, which organizes human needs into a five-tier pyramid, starting from the most basic to the most advanced. These levels are:

- Physiological needs (such as food, water, and shelter)
- Safety needs (security and protection)
- Social needs (love, belongingness, and relationships)
- Esteem needs (recognition, status, self-respect)
- Self-actualization needs (personal growth, fulfilling potential)

Maslow suggested that individuals are motivated to fulfill lower-level needs before moving up to higher-level psychological and self-fulfillment needs.

MASLOW'S HIERARCHY OF NEEDS

ABRAHAM MASLOW

Abraham Harold Maslow (April 1, 1908 - June 8, 1970) was a psychologist who studied positive human qualities and the lives of exemplary people. In 1954, Maslow created the Hierarchy of Human Needs and expressed his theories in his book, Motivation and Personality.

Self-Actualization - A person's motivation to reach his or her full potential. As shown in Maslow's Hierarchy of Needs, a person's basic needs must be met before self-actualization can be achieved.

Organizational Implication

In a workplace context, Maslow's theory guides managers to create environments that support the progressive satisfaction of employees' needs. For instance, **physiological needs** are met through fair wages and access to breaks, while **safety needs** require job security, safe working conditions, and benefits. To address **social needs**, organizations can encourage teamwork and a supportive company culture. **Esteem needs** are fulfilled through recognition programs, promotions, and increased responsibilities. Finally, **self-actualization** can be encouraged by offering challenging work, continuous learning, and opportunities for personal and professional development. Organizations that strategically align policies and culture with these needs tend to experience higher employee engagement, retention, and productivity.

Example (Organizational Context)

Consider an employee named **Amina** working at a multinational tech company.

- **Physiological Needs:** Her employer ensures she receives a fair salary, access to clean water, comfortable office seating, and lunch breaks.
- **Safety Needs:** She has a secure job contract, health insurance, and a safe working environment with clear policies.
- **Social Needs:** The company promotes teamwork and hosts regular team-building events, which helps Amina build friendships and feel part of the organizational culture.
- **Esteem Needs:** Her manager regularly appreciates her efforts, she receives performance bonuses, and she's offered the chance to lead a small project.
- **Self-Actualization:** Eventually, Amina is encouraged to innovate, attend international conferences, and contribute to a new product line—allowing her to express creativity and fulfill her potential. This progression demonstrates how organizations can structure support to motivate employees at different levels of need.

2. Theory X and Theory Y

Douglas McGregor proposed two distinct views of human beings: one basically negative, labeled Theory X, and the other basically positive, labeled Theory Y.

Theory X

The assumption that employees dislike work, are lazy, dislike responsibility, and must be coerced to perform.

Theory Y

The assumption that employees like work, are creative, seek responsibility, and can exercise self-

McGregor X - Y Theories

Theory X	Theory Y
* people need close supervision * will avoid work when possible * will avoid responsibility * that they desire only money * people must be pushed to perform	* people want independence in work * people seek responsibility * people are motivated by self-fulfilment * people naturally want to work * people will drive themselves to perform

Comparing Theory X and Theory Y

	Theory X	Theory Y
Motivation	• Assumes people dislike work	• Assumes people are self-motivated
Management Style and Control	• Authoritarian • Centralized control	• Participative, employees can join in decision making • Managers retain the power to implement decisions
Work Organization	• Specialized and often repetitive work	• Wider areas of skill or knowledge • Employees can develop their expertise and make suggestions

Management Style for Each Theory

Theory	Management Style	Characteristics
Theory X	Authoritarian / Directive	- Top-down control - Micromanagement - Strict rules and discipline - Extrinsic motivation (rewards & punishments)
Theory Y	Participative / Empowering	- Decentralized decision-making - Open communication - Job enrichment & flexibility - Intrinsic motivation (growth, responsibility)

Case Examples

Case 1: Theory X in Practice – Factory Assembly Line

In a garment manufacturing company, line workers perform repetitive tasks. Management enforces strict schedules, uses close supervision, and penalizes lateness. Employees have minimal input into processes. This **Theory X** approach ensures consistency and control in a low-skill, high-volume production environment. However, it may result in low job satisfaction and a high turnover rate unless well-balanced with incentives.

Case 2: Theory Y in Practice – Google (Creative Tech Environment)

At Google, employees are given freedom to choose projects, work flexible hours, and participate in decision-making. They are encouraged to innovate and take ownership of their work. This **Theory Y** approach empowers employees, boosts creativity, and fosters commitment. The company's culture thrives on trust, autonomy, and self-direction, aligning well with high-skill and innovation-driven roles.

3. Two-Factor Theory

Theoretical Constructs

1. Hygiene Factors (Extrinsic Determinants): Hygiene factors pertain to the contextual and environmental elements of the workplace. They address lower-order physiological and security needs.

- Primary Determinants: Base salary, working conditions, organizational policies, administrative procedures, job security, and interpersonal relations.
- Mechanism: Adequate provision of hygiene factors eliminates worker dissatisfaction but does not induce proactive motivation or long-term engagement. Conversely, deficiency in these factors directly yields job dissatisfaction.

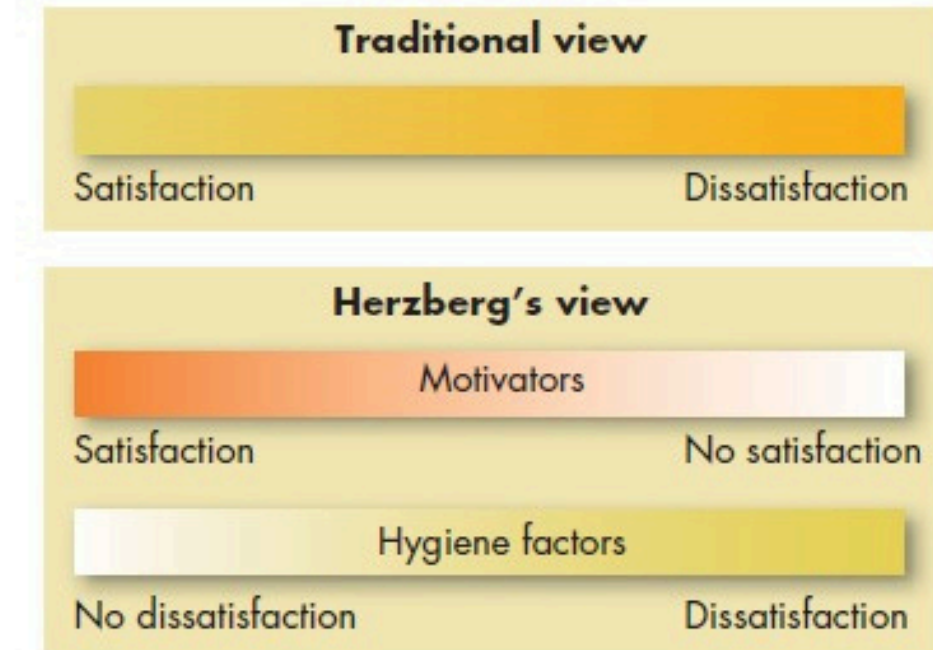

2. Motivator Factors (Intrinsic Determinants): Motivators relate directly to the content and nature of the work itself. They correspond to higher-order psychological growth and self-actualization needs.

- Primary Determinants: Professional achievement, recognition, challenging work assignments, autonomy, responsibility, and advancement opportunities.
- Mechanism: The presence of motivators fosters intrinsic job satisfaction and heightened productivity. Their absence results in a neutral state of "no satisfaction" rather than active dissatisfaction.

Exhibit 7-3

Contrasting View of Satisfaction and Dissatisfaction

Organizational Implications of Two Factor Theory

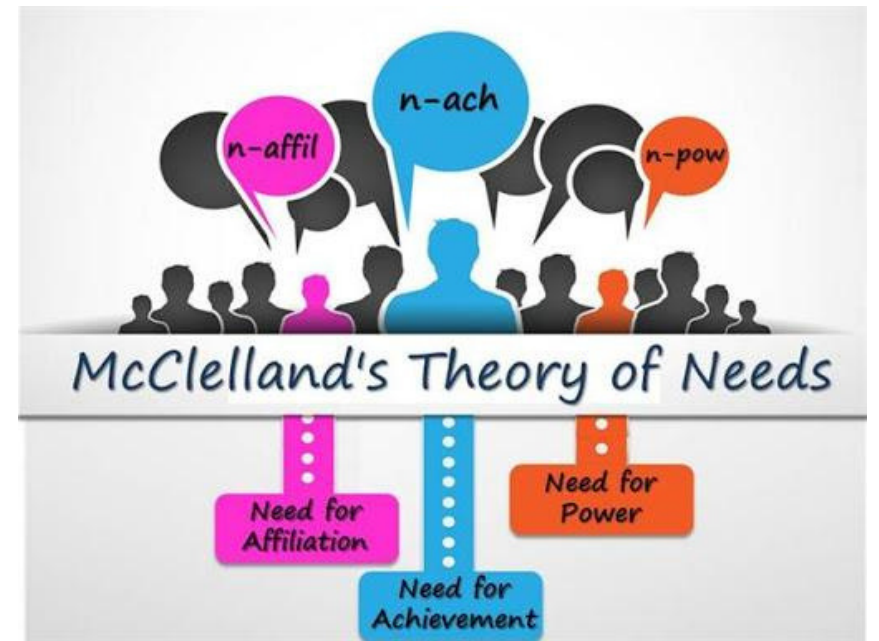

In an organizational context, Herzberg's Two-Factor Theory highlights the importance of addressing both hygiene factors and motivator factors to create a productive and satisfied workforce.

For example, a company must first ensure that basic working conditions such as, fair salaries, clear company policies, and safe, comfortable environments, etc. are in place to prevent employee dissatisfaction.

However, eliminating dissatisfaction alone is not enough to motivate employees to perform at their best. To truly inspire and engage staff, organizations must also focus on motivators by offering meaningful work, recognizing achievements, and providing opportunities for growth and career advancement.

By balancing both sets of factors, organizations can reduce turnover, boost morale, and enhance overall performance.

4. McClelland's Theory of Needs

David McClelland proposed that human motivation in the workplace is primarily driven by **three learned needs**, rather than biological instincts. These needs are:

- **Need for Achievement (nAch)** – Desire to excel and succeed.
- **Need for Power (nPow)** – Desire to influence or control others.
- **Need for Affiliation (nAff)** – Desire for friendly and close relationships.

Organizational Implications

Organizations can apply McClelland's theory by identifying which need is dominant in each employee and tailoring **job roles**, **motivation strategies**, and **rewards** accordingly:

- **High nAch** individuals thrive in roles that involve setting and achieving goals. They prefer moderate risks and clear feedback.
- **High nPow** individuals are suited for leadership roles, where they can influence others and drive organizational goals.
- **High nAff** individuals do well in roles requiring teamwork, communication, and customer relations.

By understanding these needs, organizations can:

- Enhance job-person fit
- Improve employee satisfaction
- Design targeted training and incentives
- Build effective teams with complementary motivational profiles

Management Style for Each Need

Need Type	Managerial Focus	Management Style
Achievement (nAch)	Set challenging but achievable goals; provide performance-based rewards	Goal-oriented, performance-based
Power (nPow)	Assign leadership or decision-making roles; allow influence over others	Directive, strategic
Affiliation (nAff)	Foster a team-oriented culture; emphasize harmony	Participative, people-oriented

Case Example: Sales Company

At a large **sales firm**, the HR department applies McClelland's theory in its recruitment and motivation strategy:

- **High Achievers** are placed in individual sales roles with performance bonuses. These employees set personal sales goals and value frequent feedback.
- **Power-oriented employees** are promoted to team leads and given authority over hiring and strategy decisions. They thrive in influencing group performance.
- **Affiliation-driven employees** are placed in customer service or team support roles where building rapport and maintaining harmony are key.

This structured approach improves employee satisfaction, performance, and retention, as each individual feels personally motivated by the nature of their role.

Relying on an extensive amount of research, we can predict some relationships between achievement need and job performance.

- **First**, when jobs have a high degree of personal responsibility and feedback and an intermediate degree of risk, high achievers are strongly motivated.
- **Second**, a high need to achieve does not necessarily make someone a good manager, especially in large organizations. People with a high achievement need are interested in how well they do personally, and not in influencing others to do well.
- **Third**, needs for affiliation and power tend to be closely related to managerial success. The best managers are high in their need for power and low in their need for affiliation. In fact, a high power motive may be a requirement for managerial effectiveness.

Contemporary Theories of Motivation

- 1. Self-Determination**
- 2. Theory Goal-Setting**
- 3. Theory Self-Efficacy**
- 4. Theory**
- 5. Equity Theory**
- 6. Expectancy Theory**

1. Self-Determination Theory

Self-Determination Theory is a framework for understanding human motivation. Developed by **psychologists Edward Deci and Richard Ryan**, it argues that people aren't driven just by external rewards (like money or praise), but by an innate drive to grow and feel fulfilled.

For high-quality, long-lasting motivation, humans need three core psychological needs met:

- **Autonomy:** Feeling in control of your own choices and actions.
- **Competence:** Feeling capable and effective at what you do.
- **Relatedness:** Feeling connected, valued, and a sense of belonging with others.

When these three needs are satisfied, motivation is intrinsic (people do things because they are inherently satisfying). When they are blocked, motivation becomes extrinsic (doing things only for rewards or to avoid punishment) or vanishes entirely.

Real-Life Implications of Self-Determination Theory

1. Workplace & Management

- The Trap: Relying solely on bonuses or strict monitoring often backfires. It crushes autonomy, making work feel like a chore.
- The SDT Approach: Giving employees autonomy over how or when they complete tasks, clear pathways to level up their skills (competence), and a supportive team culture (relatedness) yields higher productivity, less burnout, and lower turnover.

2. Education & Learning

- The Trap: Framing learning entirely around grades, standardized testing, and strict rules leads to superficial memorization and rapid post-exam forgetting.
- The SDT Approach: When teachers give students choices in projects (autonomy), construct tasks at the right challenge level (competence), and foster a non-judgmental classroom environment (relatedness), students develop genuine curiosity and retain knowledge long-term.

Real-Life Implications of Self-Determination Theory

3. Fitness & Health Habits

- The Trap: Exercising strictly because one feels guilty, ashamed, or want to fit a social standard usually ends in quitting within a month.
- The SDT Approach: Choosing activities one genuinely enjoys or values (autonomy), tracking steady progression instead of perfection (competence), and working out with a community or friend (relatedness) makes healthy habits stick for years.

4. Parenting & Leadership

- The Trap: Authoritarian styles ("do it because I said so") create compliance in the short term, but impair self-regulation as children grow up.
- The SDT Approach: Explaining the why behind rules and offering age-appropriate choices helps kids internalize good decisions rather than just avoiding punishment.

2. Goal-Setting Theory

- **Goal-setting theory** in fact reveals impressive effects of goal specificity, challenge, and feedback on performance. Intentions to work toward a goal are a major source of work motivation
- That is, goals tell an employee **what needs to be done and how much effort is needed.**
- Evidence strongly suggests that specific goals increase performance; that difficult goals, when accepted, result in higher performance than do easy goals; and that feedback leads to higher performance than does non-feedback
- Specific goals produce a higher level of output than the generalized goal “do your best.”

But why are people motivated by difficult goals?

- **First**, challenging goals get our attention and thus tend to help us focus.
- **Second**, difficult goals energize us because we have to work harder to attain them.

Do you study as hard for an easy exam as you do for a difficult one? Probably not.

- **Third**, when goals are difficult, people persist in trying to attain them.
- **Finally**, difficult goals lead us to discover strategies that help us perform the job or task more effectively. People do better when they get feedback on how well they are progressing toward their goals

- Goal-setting theory assumes an individual is committed to the goal and determined not to lower or abandon it.
 - The individual (1) believes he or she can achieve the goal and (2) wants to achieve it.
 - Goal commitment is most likely to occur when goals are made public
- Finally, setting specific, difficult, individual goals may have different
- effects in different cultures. Most goal-setting research has been done in the United States and Canada, where individual achievement and performance are most highly valued.

3. Self-Efficacy Theory

- **Self-efficacy** (also known as *social cognitive theory* or *social learning theory*) refers to an individual's belief that he or she is capable of performing a task. The higher your self-efficacy, the more confidence you have in your ability to succeed.
- So, in difficult situations, people with low self-efficacy are more likely to lessen their effort or give up altogether, while those with high self-efficacy will try harder to master the challenge.
- Self-efficacy can create a positive spiral in which those with high efficacy become more engaged in their tasks and then, in turn, increase performance, which increases efficacy²⁹

- Individuals high in self-efficacy also seem to respond to negative feedback with increased effort and motivation, while those low in self- efficacy are likely to lessen their effort after negative feedback

- **How can managers help their employee achieve high levels of self- efficacy?**

- By bringing goal-setting theory and self-efficacy theory together.
- Goal-setting theory and self-efficacy theory don't compete; they complement each other.

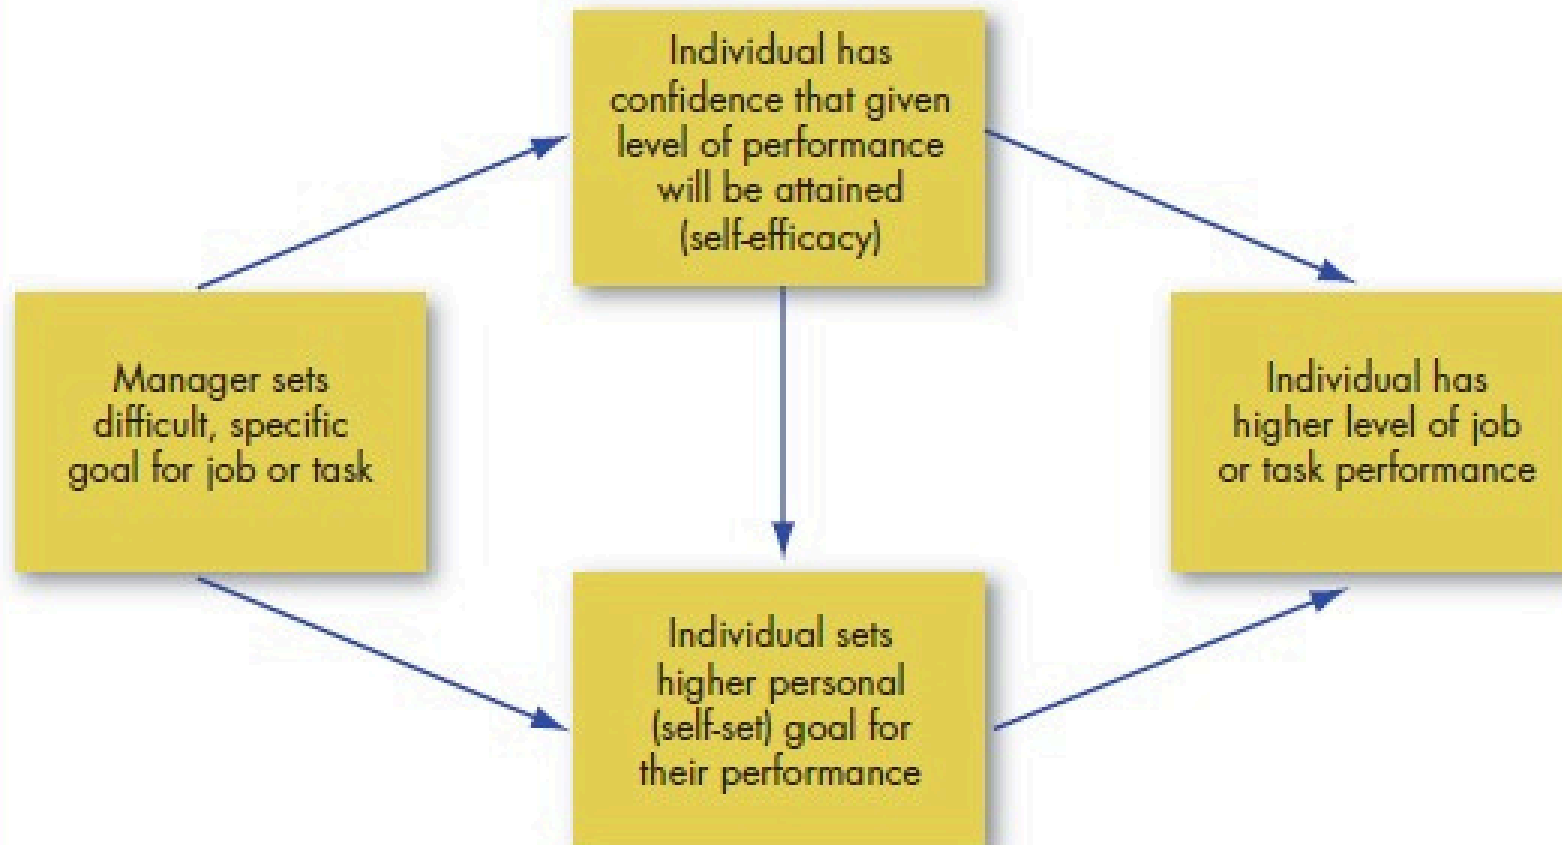

High Self- Efficacy

Low Self- Efficacy

Exhibit 7-5

Joint Effects of Goals and Self-Efficacy on Performance

The researcher who developed self-efficacy theory, Albert Bandura, proposes some ways in which self-efficacy can be increased

1. Enactivemastery

(gaining relevant experience with the task or job. If you've been able to do the job successfully in the past, you're more confident you'll be able to do it in the future.

2. Vicarious modeling

becoming more confident because you see someone else doing the task. (If your friend slims down, it increases your confidence that you can lose weight, too.)

3. Verbal persuasion.

(becoming more confident because someone convinces you that you have the skills necessary to be successful. Motivational speakers use this tactic.

4. Equity Theory

The theory says that individuals compare their job inputs and outcomes with those of others and then respond to eliminate any inequities.

It's called Equity Theory because "equity" means fairness. The theory says that a person isn't just motivated by what he gets paid; he is motivated by whether he feels treated fairly compared to others.

The referent an employee selects adds to the complexity of **equity theory**

There are four referent comparisons:

- 1. Self–inside.** An employee's experiences in a different position inside the employee's current organization.
- 2. Self–outside.** An employee's experiences in a situation or position outside the employee's current organization.
- 3. Other–inside.** Another individual or group of individuals inside the employee's organization.
- 4. Other–outside.** Another individual or group of individuals outside the employee's organization.

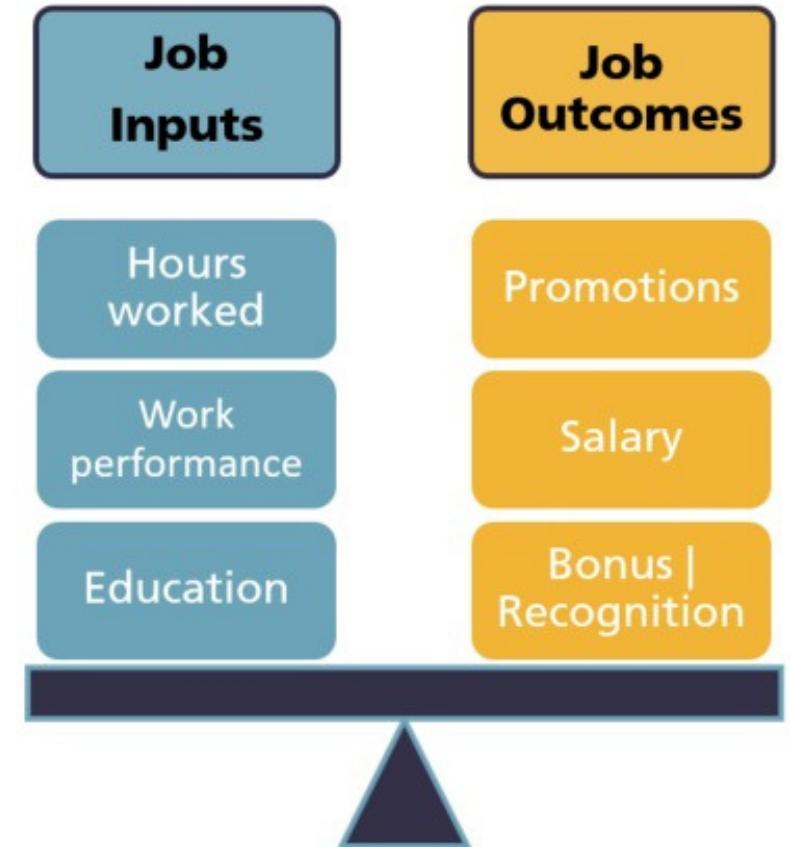

Equity vs. Equality: The Big Difference

Why is it called **Equity Theory** and not **Equality Theory**? Because fairness is not the same as everyone getting the exact same thing.

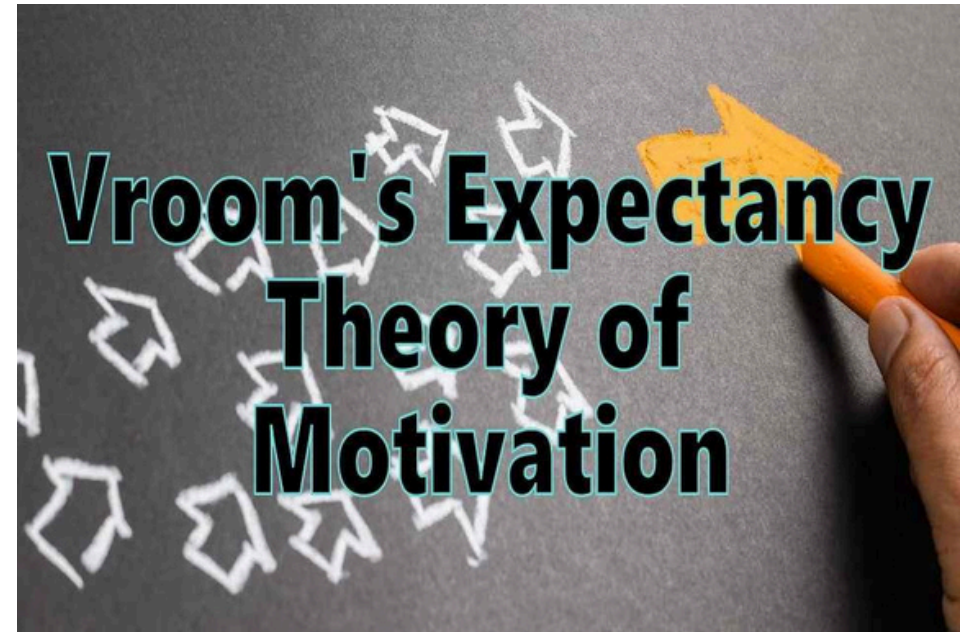

- Equality means sameness. It gives every individual or group the exact same resources, opportunities, or treatment, regardless of their starting point or specific needs.
- Equality = Everyone gets paid \$50,000, no matter how hard they work. (This often feels unfair to the hardest workers).
- Equity means fairness. It recognizes that each person has different circumstances, advantages, or barriers, and distributes resources and opportunities specifically so that everyone can reach an equal outcome.
- Equity = The person who works twice as hard or has more experience gets rewarded proportionally more.

Based on equity theory, employees **who perceive inequity** will make one of six choices

1. Change inputs (exert less effort if underpaid or more if overpaid).
2. Change outcomes (individuals paid on a piece-rate basis can increase their pay by producing a higher quantity of units of lower quality).
3. Distort perceptions of self (“I used to think I worked at a moderate pace, but now I realize I work a lot harder than everyone else.”).
4. Distort perceptions of others (“Mike’s job isn’t as desirable as I thought.”).
5. Choose a different referent (“I may not make as much as my brother-in-law, but I’m doing a lot better than my Dad did when he was my age.”).
6. Leave the field (quit the job).

5. Expectancy Theory

- Expectancy theory argues that the strength of our tendency to act a certain way depends on the strength of our expectation of a given outcome and its attractiveness.
- In more practical terms, employees will be motivated to exert a high level of effort when they believe it will lead to a good performance appraisal; that a good appraisal will lead to organizational rewards such as bonuses, salary increases, or promotions; and that the rewards will satisfy the employees' personal goals.

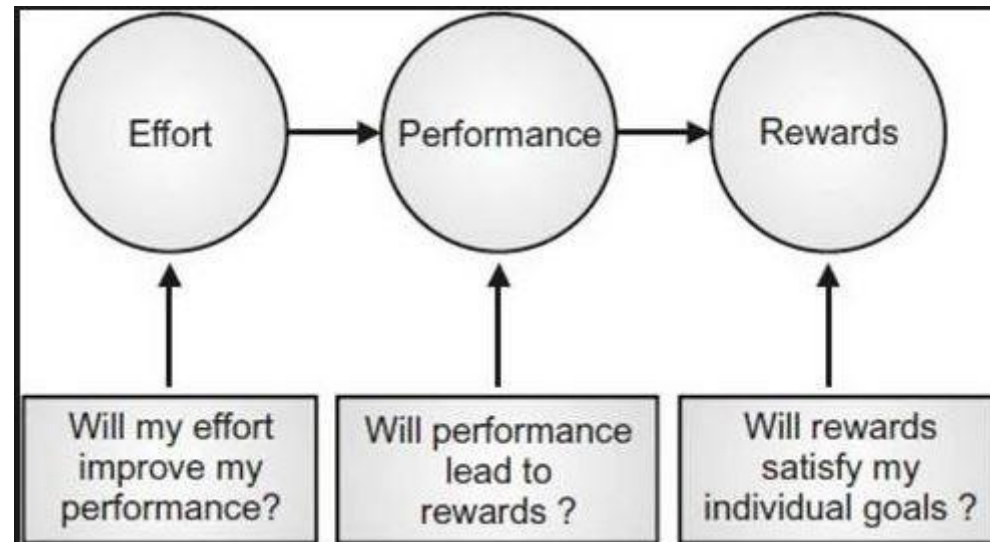

The theory, therefore, focuses on three relationships

1. **Effort–performance relationship.** The probability perceived by the individual that exerting a given amount of effort will lead to performance.
2. **Performance–reward relationship.** The degree to which the individual believes performing at a particular level will lead to the attainment of a desired outcome.
3. **Rewards–personal goals relationship.** The degree to which organizational rewards satisfy an individual's personal goals or needs and the attractiveness of those potential rewards for the individual.

Expectancy theory helps explain why a lot of workers aren't motivated on their jobs and do only the minimum necessary to get by.

- First, *if I give a maximum effort, will it be recognized in my performance appraisal?*
- Second, *if I get a good performance appraisal, will it lead to organizational rewards?*
- Finally, *if I'm rewarded, are the rewards attractive to me?*

YES
you
can
