

Ch 3: True/False Questions

1. Cognitive development occurs in a continuous, gradual process without distinct stages. (False)
2. Piaget proposed four main stages of cognitive development. (True)
3. The sensorimotor stage occurs from birth to about 2 years. (True)
4. Object permanence develops during the preoperational stage. (False)
5. In the sensorimotor stage, infants learn through their senses and actions. (True)
6. The preoperational stage is characterized by logical thinking. (False)
7. Egocentrism is common in the preoperational stage. (True)
8. Children in the preoperational stage can easily understand conservation. (False)
9. The concrete operational stage begins around age 7. (True)
10. Abstract thinking develops in the concrete operational stage. (False)
11. Conservation is understood during the concrete operational stage. (True)
12. Formal operational stage involves the development of abstract reasoning. (True)
13. Hypothetical thinking appears in the formal operational stage. (True)
14. Children in the concrete operational stage struggle with logical reasoning. (False)
15. Piaget believed all children progress through stages at the same rate. (False)
16. Assimilation involves changing existing schemas to fit new information. (False)
17. Accommodation involves modifying schemas based on new experiences. (True)

- 18. Schema refers to a mental framework used to organize information. (True)
- 19. Egocentrism means the ability to understand others' perspectives. (False)
- 20. The formal operational stage typically begins around age 11 or older. (True)
